

AI Acknowledgement

In my Assignment 2 – APP Design Proposal, I employed AI tools for the app moodboard.

Specifically, I utilized the AI tool Gemini to generate the following 1 image, which serve to illustrate the examples within my mood board more effectively.

Firstly, this is image I generated. I described to Gemini: ' User opens the app and enters a “grey city” map, where the world looks incomplete and unconnected. They start by choosing a running mission, which is a route designed as a visual shape (such as a flower, animal and food), with different distances and difficulty levels depending on their ability.

Besides, the users can either run alone or run with other users on the app. We will divide the users by gender, such as male, female, and LGBTQ+, and by regions.

Once the run begins, the app uses GPS to track their movement in real time, gradually drawing the selected shape on the map as they move through the city.

During the run, users can see their progress and feel the route being “created” step by step, turning physical movement into a creative act.

After completing the route, the full artwork is revealed, and the surrounding area on the map transforms from grey into colour, symbolising restoration of the world. Users then receive rewards such as points, badges, and unlockable content, including new routes and short story fragments that expand the app's narrative world. This app is also collaborating with the local shops, so users who complete the missions can get discounts in their city.

In order to create a nice relationship between people and running, the app will also send reminders to the runners to check their body condition and injuries. Finally, they can save their run in a personal gallery, share it with friends, or join group runs where multiple users collaborate to create larger shared artworks, making running both a creative and social experience.'
